

### **Dataset Background:**

The dataset was created with the help of more than 5,400 unique crowd actors.

Developers like you have successfully created classification models based on the training set and found that they perform well on the validation set. Running their models on the test set, they can achieve scores of up to 91 percent.

The video data is provided as one large TGZ archive, split into parts of 10 GB maximum. The total download size is 19.4 GB. The archive contains webm-files, using the VP9 codec, with a height of 240px. Files are numbered from 1 to 220847.

For each video in the training and validation sets there is an object annotation in addition to the video label, if applicable. For example, for a label like "Putting [something] onto [something]," there is also an annotated version, such as "Putting a cup onto a table." In total, there are 318,572 annotations involving 30,408 unique objects.

### **Dataset Instructions:**

In order to extract the TGZ archive, the files must be downloaded and concatenated in the right order. Only then they can be extracted. Unzip the downloaded zip files separately and then run the given command in the documentation to extract all the video files.

1. `unzip 20bn-something-something-v2-\???.zip`
2. `cat 20bn-something-something-v2-?? | tar -xvf -`
